

cold segments C1..C20: one fresh pinned process per arm on new point s$(i{-}1)$ (role rankcut-cold-v1)

rank blocks K1..K4 (new seeds 201..204): same 600 attempts in every arm; table must equal B's

Primary (frozen):

$$R = \frac{\overline{\mathrm{rank}}(kS) + \overline{\mathrm{cold}}(cS)}{\overline{\mathrm{rank}}(kR) + \overline{\mathrm{cold}}(cR)} \quad \text{(end-to-end cold)}$$

improvement iff 95% lower bound > 1; bootstrap: blocks, then attempts paired within a block, and points.
Gates: per block one relation digest, one per-attempt probe vector and one root-call count across kS, kR, kRaa, kRX.
