(a) Bailey's walk, one lane-step

(b) canonicalizing adding walk, one lane-step

Shared code (generic over the field): f131.h port (n=131, modulus 0xd1d0d000d0000000d000000000000000d) or 2-limb CLMUL (n=83, $z^{83} + z^7 + z^4 + z^2 + 1$); nibble-table basis changes; Itoh–Tsujii inversion; lift_scan of canon-n131. Same DP rule for both: $\mathrm{HW}(x) \le 52$ ($2^{-6.16}$) at n=131, ≤ 31 ($2^{-5.83}$) at n=83.
Ablations priced on the same path: canon_null (no canonicalization), canon_nolift ($k = 0$), bailey_nodpc (raw key at DPs); controls: A/A copies, canon_exh (exhaustive canonicalizer).
